Administer Azure Virtual Machines

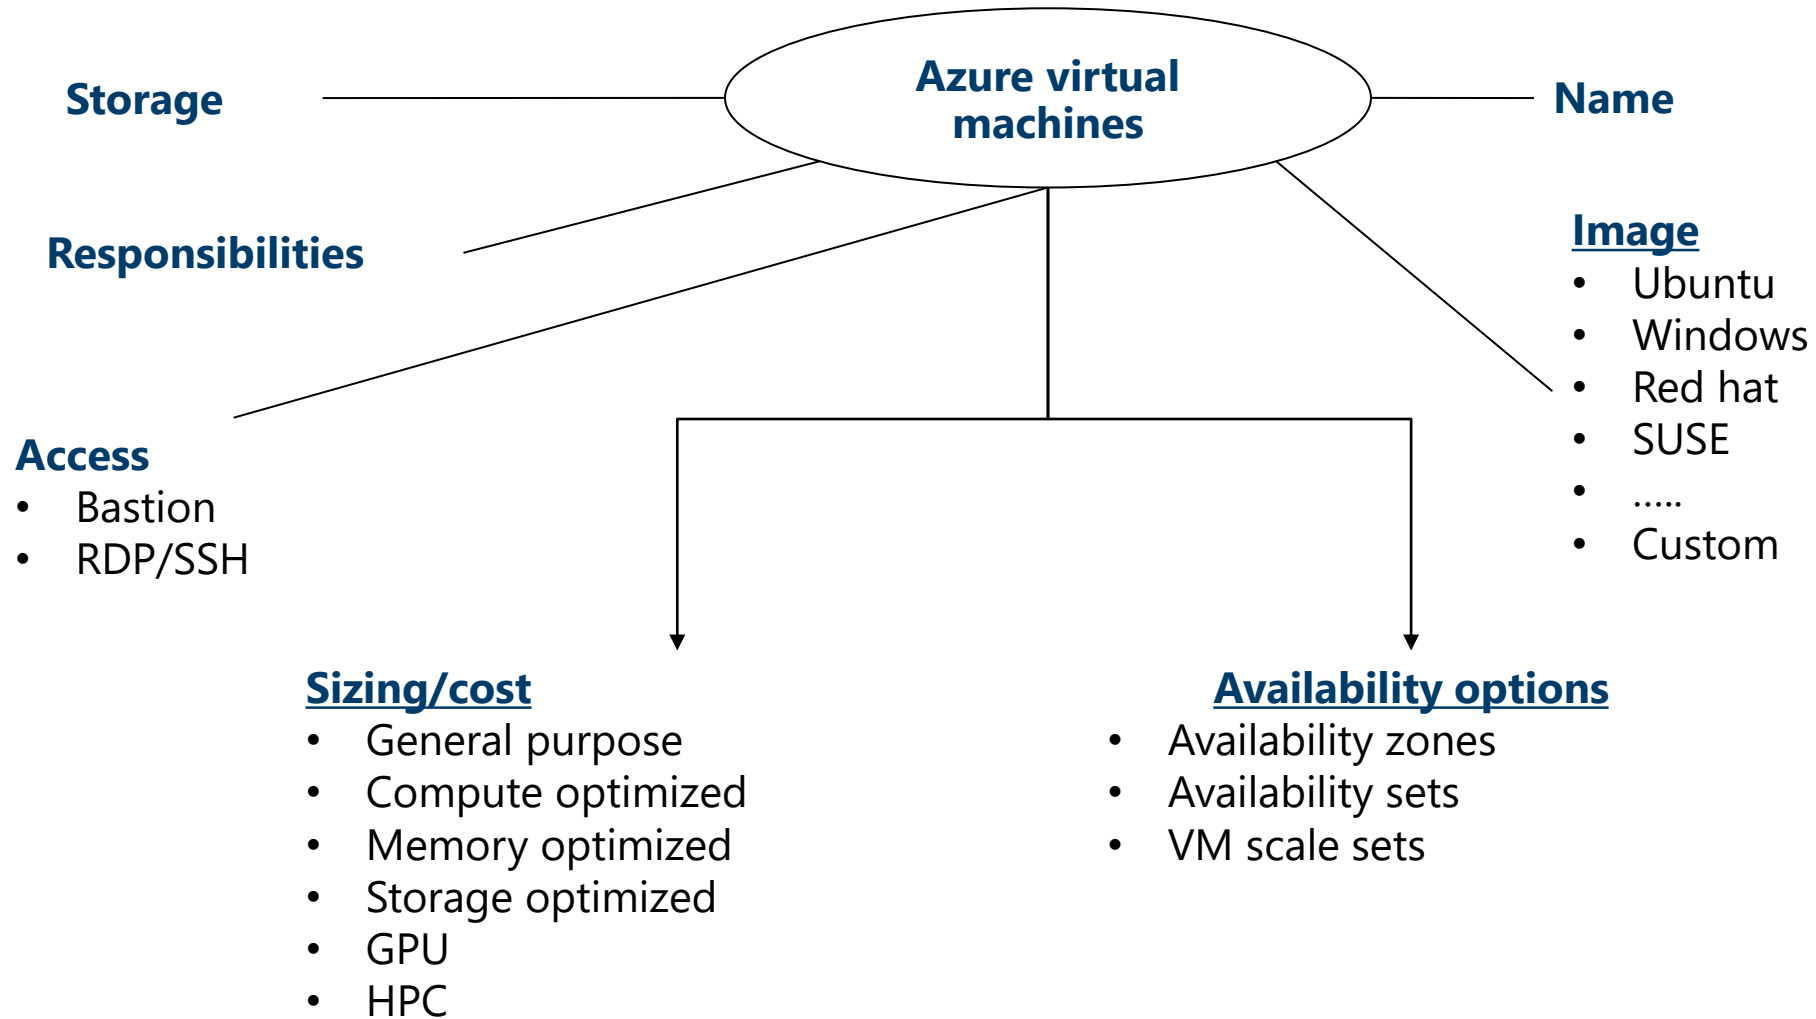

AZ-104 Course Outline

- 01: Administer Identity
- 02: Administer Governance and Compliance
- 03: Administer Azure Resources
- 04: Administer Virtual Networking
- 05: Administer Intersite Connectivity
- 06: Administer Network Traffic Management
- 07: Administer Azure Storage
- ~~08: Administer Azure Virtual Machines~~
- 09: Administer PaaS Compute Options
- 10: Administer Data Protection
- 11: Administer Monitoring

Learning Objectives - Administer Azure Virtual Machines

- [Configure Virtual Machines](#)
- [Configure Virtual Machine Availability](#)
- [Lab 08 – Manage Virtual Machines](#)

Administer Virtual Machines whiteboard

Configure Virtual Machines

Review Cloud Services Responsibilities

	Responsibility	SaaS	PaaS	IaaS	On-prem
Responsibility always retained by the customer	Information and data	Customer	Customer	Customer	Customer
	Devices (Mobile and PCs)	Customer	Customer	Customer	Customer
	Accounts and identities	Customer	Customer	Customer	Customer
Responsibility varies by type	Identity and directory infrastructure	Shared	Shared	Customer	Customer
	Applications	Microsoft	Shared	Customer	Customer
	Network controls	Microsoft	Shared	Customer	Customer
	Operating system	Microsoft	Microsoft	Customer	Customer
Responsibility transfers to cloud provider	Physical hosts	Microsoft	Microsoft	Microsoft	Customer
	Physical network	Microsoft	Microsoft	Microsoft	Customer
	Physical datacenter	Microsoft	Microsoft	Microsoft	Customer

 Microsoft	 Customer	 Shared
---	--	--

Plan Virtual Machines

Start with the network

Name the virtual machine

Choose a location

- Each region has different hardware and service capabilities
- Locate Virtual Machines as close as possible to your users and to ensure compliance and legal obligations

Consider pricing

70+ Azure regions
Available in 140 countries

Determine Virtual Machine Sizing

Type	Description
General purpose	Balanced CPU-to-memory ratio.
Compute optimized	High CPU-to-memory ratio.
Memory optimized	High memory-to-CPU ratio.
Storage optimized	High disk throughput and I/O.
GPU	Specialized virtual machines targeted for heavy graphic rendering and video editing.
High performance compute	Our fastest and most powerful CPU virtual machines

Determine Virtual Machine Storage

Each Azure VM has two or more disks:

- OS disk
- Temporary disk (not all SKUs have one, content can be lost)
- Data disks (optional)

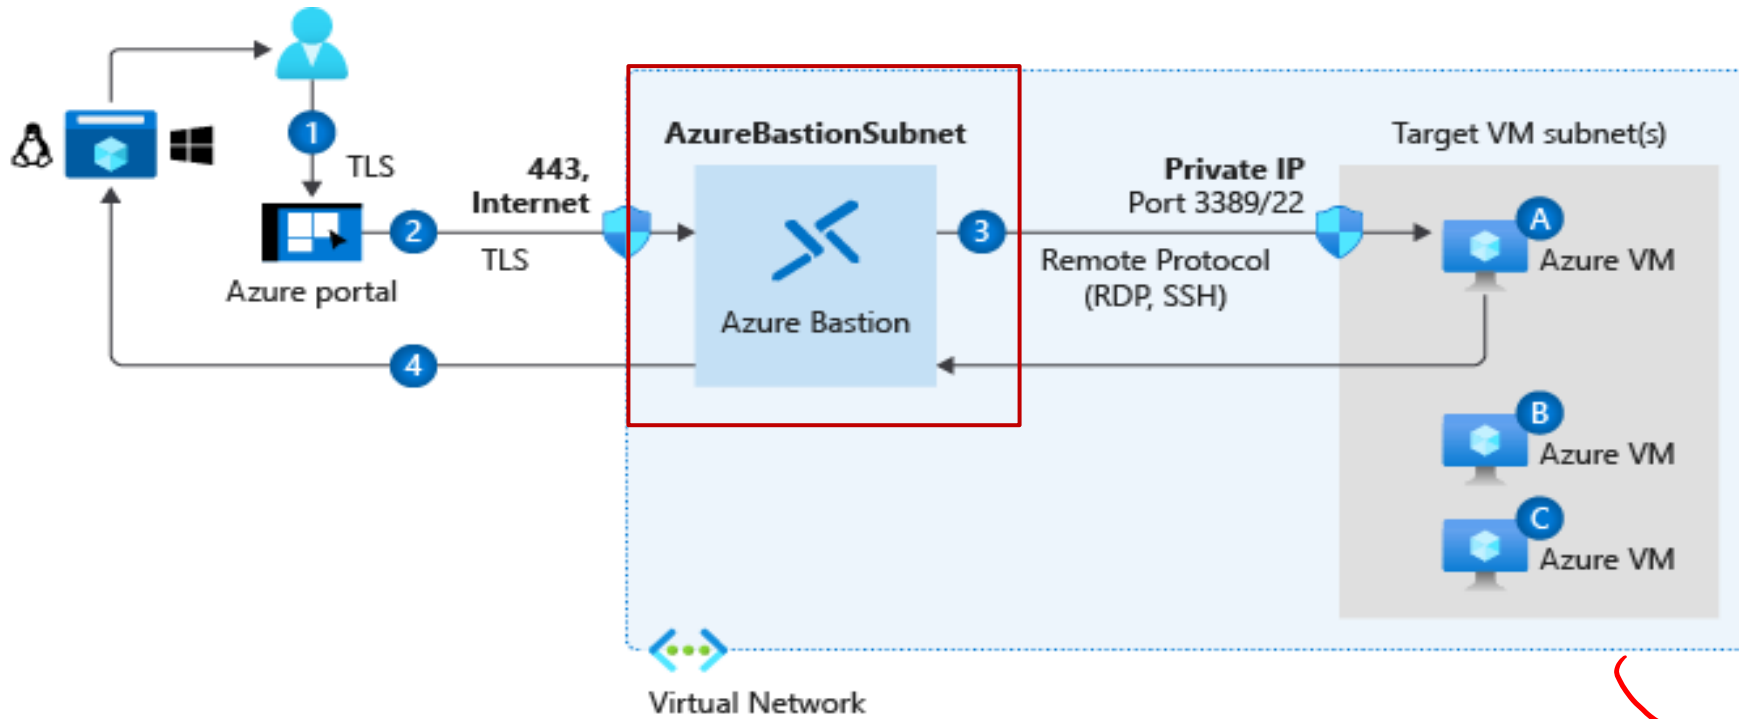

OS and data disks reside in Azure Storage accounts:

- Azure-based storage service
- Standard (HDD, SSD) or Premium (SSD), or Ultra (SSD)

Azure VMs use managed disks

Connect to Virtual Machines

Handwritten notes: **vn** (above a box icon) and **vNet 2** (next to a red curved arrow pointing from the VM subnet to the Bastion subnet).

Bastion Subnet for RDP/SSH through the Portal over SSL

Remote Desktop Protocol for Windows-based Virtual Machines

Secure Shell Protocol for Linux based Virtual Machines

Connect to Windows Virtual Machines

Remote Desktop Protocol (RDP) creates a GUI session and accepts inbound traffic on TCP port 3389

WinRM creates a command-line session so you can run scripts

Connect to Linux Virtual Machines

Administrator account

Authentication type

Username * ⓘ

SSH public key * ⓘ

Provide an RSA public key in the single-line format (starting with "ssh-rsa") or the multi-line PEM format. You can generate SSH keys using ssh-keygen on Linux and OS X, or PuTTYGen on Windows.

[Learn more about creating and using SSH keys in Azure](#)

Authenticate with a SSH public key or password

SSH is an encrypted connection protocol that allows secure logins over unsecured connections

There are public and private keys

Configure Virtual Machine Availability

Setup Availability Sets

Instance details

Name * ⓘ

avset01

Region * ⓘ

(US) East US

Fault domains ⓘ

2

Update domains ⓘ

5

Use managed disks ⓘ

No (Classic) Yes (Aligned)

Two or more instances in
Availability Sets = 99.95% SLA

Configure multiple
Virtual Machines in
an Availability Set

Configure each
application tier
into separate
Availability Sets

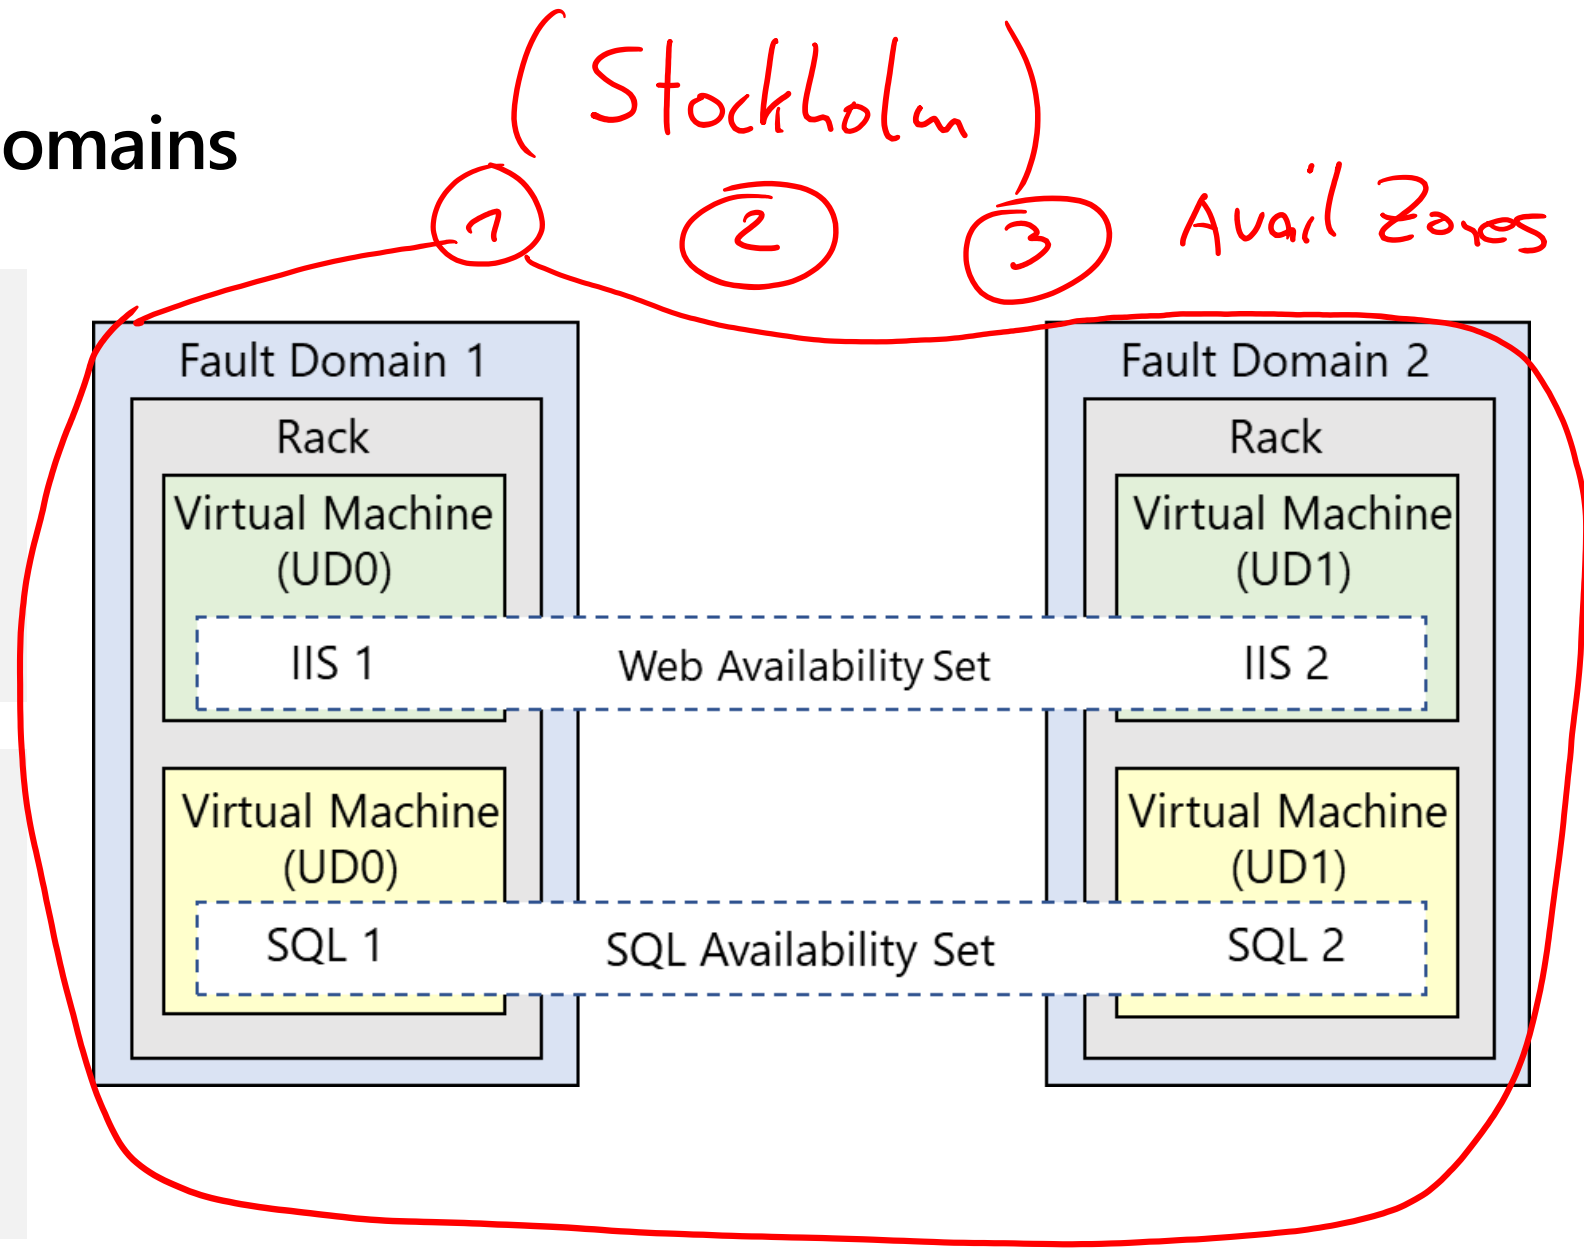

Combine a Load
Balancer with
Availability Sets

Use managed disks
with the Virtual
Machines

Review Update and Fault Domains

Update domains allows Azure to perform incremental or rolling upgrades across a deployment. During planned maintenance, only one update domain is rebooted at a time

Fault Domains are a group of Virtual Machines that share a common set of hardware, switches, that share a single point of failure. VMs in an availability set are placed in at least two fault domains

Review Availability Zones

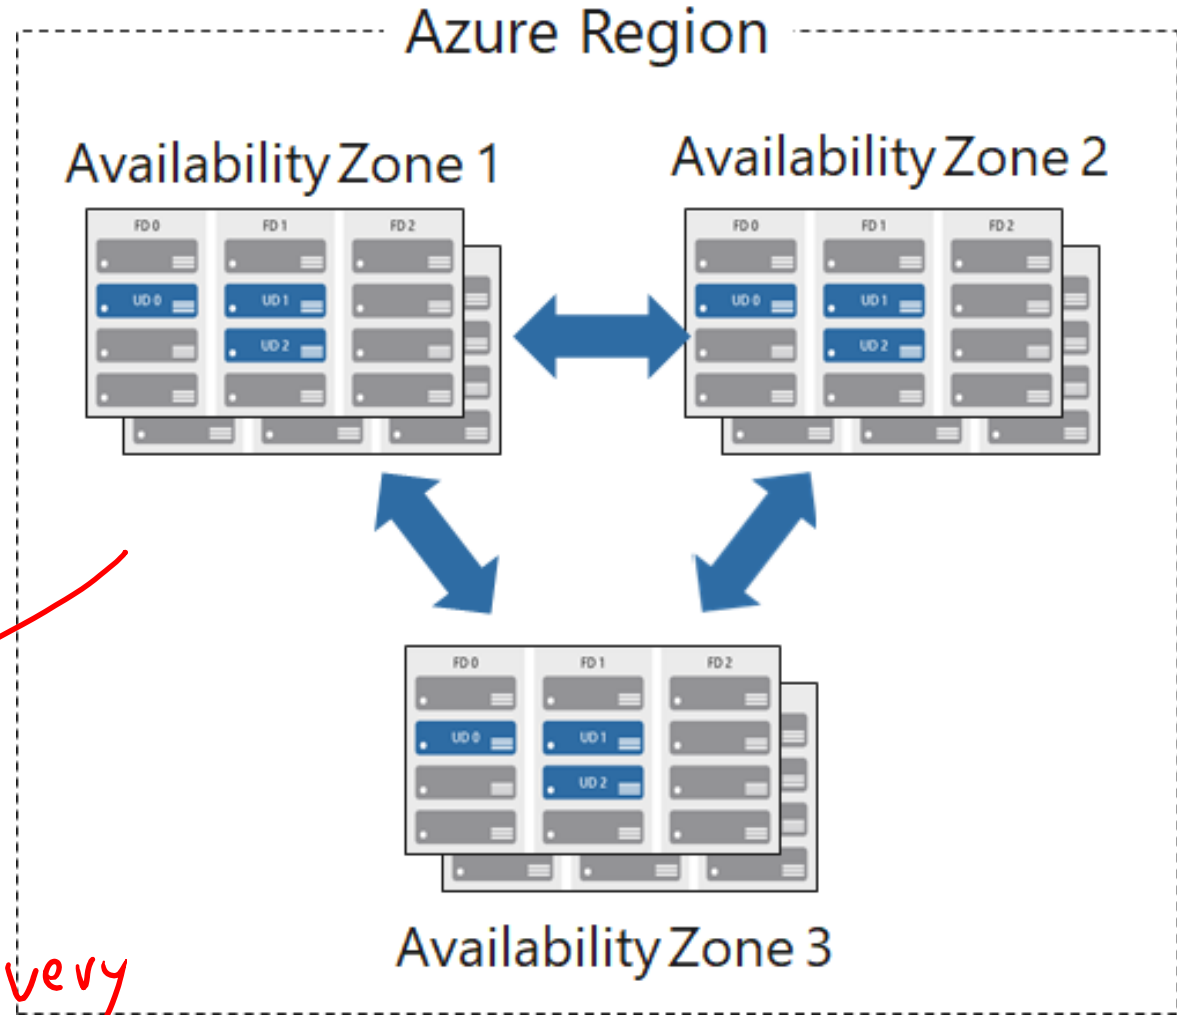

Unique physical locations
in a region

Includes datacenters with independent
power, cooling, and networking

Protects from datacenter failures

Combines update and
fault domains

Provides 99.99% SLA

Azure
Site
Recovery

Region 2

Compare Vertical to Horizontal Scaling

Vertical scaling

Vertical scaling (scale up and scale down) is the process of increasing or decreasing power to a single instance of a workload; usually manual

Horizontal scaling

Horizontal scaling (scale out and scale in) is the process of increasing or decreasing the number of instances of a workload; frequently automated

Create Scale Sets

Instance count. Number of VMs in the scale set (0 to 1000)

Instance size. The size of each virtual machine in the scale set

Azure Spot Instance. Unused capacity at a discounted rate

Use managed disks

Enable scaling beyond 100 instances

Orchestration

A scale set has a "scale set model" that defines the attributes of virtual machine instances (size, number of data disks, etc). As the number of instances in the scale set changes, new instances are added based on the scale set model.

[Learn more about the scale set model](#)

Orchestration mode * ⓘ

- ☒ **Flexible:** achieve high availability at scale with identical or multiple virtual machine types
- ☐ **Uniform:** optimized for large scale stateless workloads with identical instances

Security type ⓘ

Standard

Instance details

Image * ⓘ

 Ubuntu Server 20.04 LTS - x64 Gen2

Lab – Manage Virtual Machines

Lab 08 – Manage Virtual Machines

You are tasked with identifying different options for deploying and configuring Azure Virtual Machines.

Objectives

Task 1: Deploy zone-resilient Virtual Machines

Task 2: Configure Azure virtual machines with extensions

Task 3: Scale Azure virtual machines

Task 4: Register resource providers

Task 5: Deploy zone-resilient virtual machine scale sets

Task 6: Configure virtual machine scale sets with extensions

Task 7: Scale virtual machine scale sets

Next slide for an architecture diagram
